

COMPUTER NETWORKS

Instructor: Mr. B. V. Sathish Kumar, Assistant Professor
Department of Electronics and Communication Engineering

UNIT - V

VVIT

Syllabus

- Transport Layer Design Issues, Connection Establishment, Connection Termination, Transport and User Datagram Protocols
- ❖ Application Layer –Design Issues, DNS, WWW, HTTP/HTTPS, E-mail

Figure: Seven layers of OSI Model

Application Layer

TCP/IP Layers

TCP/IP Prototocols

Application Layer	НТТР	FTP	Telr	net	(SMTP	DNS
Transport Layer			UDP				
Network Layer	IP		AR	ARP		ICMP	IGMP
Network Interface Layer	Ethernet		Token Ring		ļ	Other Link-Layer Protocols	

FTP-File Transfer Protocol

Transferring files from one computer to another is one of the most common tasks expected from a networking or internetworking environment. As a matter of fact, the greatest volume of data exchange in the Internet today is due to file transfer.

Note

FTP uses the services of TCP. It needs two TCP connections.

The well-known port 21 is used for the control connection and the well-known port 20 for the data connection.

Figure: FTP

Figure: Using the control connection

Figure: Using the data connection

DNS-Domain Name System

- Although programs theoretically could refer to Web pages, mailboxes, and other resources by using the network (e.g., IP) addresses of the computers on which they are stored, these addresses are hard for people to remember.
- Also, browsing a company's Web pages from 128.111.24.41 means that if the company moves the Web server to a different machine with a different IP address, everyone needs to be told the new IP address.
- Consequently, high-level, readable names were introduced in order to decouple machine names from machine addresses.

VVIT

Cntd...

- In this way, the company's Web server might be known as www.cs.washington.edu regardless of its IP address.
- Nevertheless, since the network itself understands only numerical addresses, some mechanism is required to convert the names to network addresses.
- The essence of DNS is the invention of a hierarchical, domainbased naming scheme and a distributed database system for implementing this naming scheme.
- It is primarily used for mapping host names to IP addresses but can also be used for other purposes.
- To map a name onto an IP address, an application program calls a library procedure called the resolver, passing it the name as a parameter.

Cntd...

For the Internet, the top of the naming hierarchy is managed by an organization called ICANN (Internet Corporation for Assigned Names and Numbers). ICANN was created for this purpose in 1998.

Topics discussed in this section:

- The DNS name space
- Domain Resource records
- Name servers

Figure: Example of using the DNS service

Figure: DNS IN THE INTERNET

The DNS Name Space

A portion of the Internet domain name space.

Figure: Domain names and labels

Cntd...

Domain	Intended use	Start date	Restricted?	
com	Commercial	1985	No	
edu	Educational institutions	1985	Yes	
gov	Government	1985	Yes	
int	International organizations	1988	Yes	
mil	Military	1985	Yes	
net	Network providers	1985	No	
org	Non-profit organizations	1985	No	
aero	Air transport	2001	Yes	
biz	Businesses	2001	No	
coop	Cooperatives	2001	Yes	
info	Informational	2002	No	
museum	Museums	2002	Yes	
name	People	2002	No	
pro	Professionals	2002	Yes	
cat	Catalan	2005	Yes	
jobs	Employment	2005	Yes	
mobi	Mobile devices	2005	Yes	
tel	Contact details	2005	Yes	
travel	Travel industry	2005	Yes	
XXX	Sex industry	2010	No	

Generic top-level domains

Domain Resource Records

Туре	Meaning	Value		
SOA	Start of authority	Parameters for this zone		
Α	IPv4 address of a host	32-Bit integer		
AAAA	IPv6 address of a host	128-Bit integer		
MX	Mail exchange	Priority, domain willing to accept email		
NS	Name server	Name of a server for this domain		
CNAME	Canonical name	Domain name		
PTR	Pointer	Alias for an IP address		
SPF	Sender policy framework	Text encoding of mail sending policy		
SRV	Service	Host that provides it		
TXT	Text	Descriptive ASCII text		

The principal DNS resource record types

Name Servers

Part of the DNS name space divided into zones (which are circled).

Figure: Hierarchy of name servers

Cntd...

Example of a resolver looking up a remote name in 10 steps.

Note

A primary server loads all information from the disk file; the secondary server loads all information from the primary server.

When the secondary downloads information from the primary, it is called zone transfer.

DNS Message

DNS has two types of messages: query and response. Both types have the same format.

The query message consists of a header and question records.

The response message consists of a header, question records, answer records, authoritative records, and additional records.

Figure: Query and response messages

b. Response

Figure: Header format

Identification	Flags		
Number of question records	Number of answer records (all 0s in query message)		
Number of authoritative records (all 0s in query message)	Number of additional records (all 0s in query message)		

Note

DNS can use the services of UDP or TCP using the well-known port 53.

Electronic Mail (E-mail)

Topics discussed in this section:

- Architecture and services
- The user agent
- Message formats
- Message transfer
- Final delivery

Figure: First scenario in electronic mail

Note

When the sender and the receiver of an e-mail are on the same system, we need only two user agents.

Figure: Second scenario in electronic mail

UA: user agent

MTA: message transfer agent

When the sender and the receiver of an e-mail are on different systems, we need two UAs and a pair of MTAs (client and server).

Figure: Third scenario in electronic mail

Note

When the sender is connected to the mail server via a LAN or a WAN, we need two UAs and two pairs of MTAs (client and server).

Figure: Fourth scenario in electronic mail

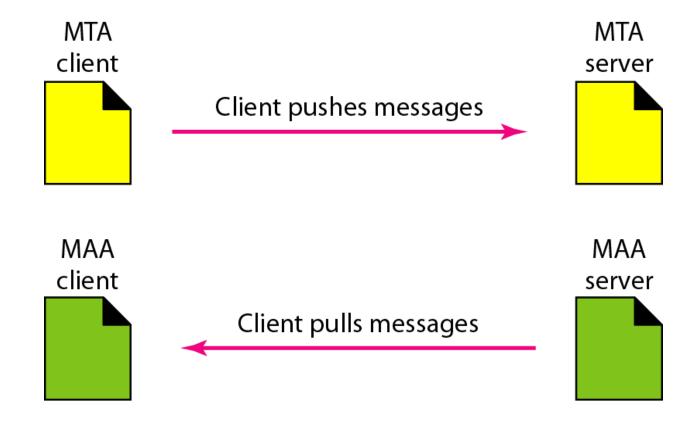

Figure: Push versus pull in electronic email

Note

When both sender and receiver are connected to the mail server via a LAN or a WAN, we need two UAs, two pairs of MTAs and a pair of MAAs.

This is the most common situation today.

Message summary

A. Student	Graduate studies?	Mar 1
Dear Professor,		
	eted my undergraduate studies with excellent university. I will be visiting	
	Message	

Typical elements of the user agent interface

Figure: Services of user agent

Message Formats

Header	Meaning	
To:	Email address(es) of primary recipient(s)	
Cc:	Email address(es) of secondary recipient(s)	
Bcc:	Email address(es) for blind carbon copies	
From:	Person or people who created the message	
Sender:	Email address of the actual sender	
Received:	Line added by each transfer agent along the route	
Return-Path:	Can be used to identify a path back to the sender	

RFC 5322 header fields related to message transport.

Header	Meaning	
Date:	The date and time the message was sent	
Reply-To:	Email address to which replies should be sent	
Message-Id:	Unique number for referencing this message later	
In-Reply-To:	Message-Id of the message to which this is a reply	
References:	Other relevant Message-Ids	
Keywords:	User-chosen keywords	
Subject:	Short summary of the message for the one-line display	

Some fields used in the RFC 5322 message header.

Header	Meaning
MIME-Version:	Identifies the MIME version
Content-Description:	Human-readable string telling what is in the message
Content-Id:	Unique identifier
Content-Transfer-Encoding:	How the body is wrapped for transmission
Content-Type:	Type and format of the content

Message headers added by MIME.

Туре	Example subtypes	Description
text	plain, html, xml, css	Text in various formats
image	gif, jpeg, tiff	Pictures
audio	basic, mpeg, mp4	Sounds
video	mpeg, mp4, quicktime	Movies
model	vrml	3D model
application	octet-stream, pdf, javascript, zip	Data produced by applications
message	http, rfc822	Encapsulated message
multipart	mixed, alternative, parallel, digest	Combination of multiple types

MIME content types and example subtypes.

Keyword	Description
AUTH	Client authentication
BINARYMIME	Server accepts binary messages
CHUNKING	Server accepts large messages in chunks
SIZE	Check message size before trying to send
STARTTLS	Switch to secure transport (TLS; see Chap. 8)
UTF8SMTP	Internationalized addresses

Some SMTP extensions.

Final Delivery

Command	Description
CAPABILITY	List server capabilities
STARTTLS	Start secure transport (TLS; see Chap. 8)
LOGIN	Log on to server
AUTHENTICATE	Log on with other method
SELECT	Select a folder
EXAMINE	Select a read-only folder
CREATE	Create a folder
DELETE	Delete a folder
RENAME	Rename a folder
SUBSCRIBE	Add folder to active set
UNSUBSCRIBE	Remove folder from active set

IMAP (version 4) commands.

List the available folders	
List the active folders	
Get the status of a folder	
Add a message to a folder	
Get a checkpoint of a folder	
Get messages from a folder	
Find messages in a folder	
Alter message flags	
Make a copy of a message in a folder	
Remove messages flagged for deletion	
Issue commands using unique identifiers	
Do nothing	
Remove flagged messages and close folder	
Log out and close connection	

IMAP (version 4) commands.

World Wide Web

The WWW today is a distributed client/server service, in which a client using a browser can access a service using a server. However, the service provided is distributed over many locations called sites.

Figure: Architecture of WWW

Figure: Browser

Figure: URL

Protocol :// Host : Port / Path

HTTP

The Hypertext Transfer Protocol (HTTP) is a protocol used mainly to access data on the World Wide Web.

HTTP functions as a combination of FTP and SMTP.

HTTP uses the services of TCP on well-known port 80.

Figure: HTTP transaction

Figure: Request and response messages

Request line Headers A blank line Body (present only in some messages)

Request message

Status line **Headers** A blank line Body (present only in some messages)

Response message

Figure: Request and status lines

Table: Methods

Method	Action	
GET	Requests a document from the server	
HEAD	Requests information about a document but not the document itself	
POST	Sends some information from the client to the server	
PUT	Sends a document from the server to the client	
TRACE	Echoes the incoming request	
CONNECT	Reserved	
OPTION	Inquires about available options	

Table: Status codes

Code	Phrase	Description	
	Informational		
100	Continue	The initial part of the request has been received, and the client may continue with its request.	
101	Switching	The server is complying with a client request to switch protocols defined in the upgrade header.	
	Success		
200	OK	The request is successful.	
201	Created	A new URL is created.	
202	Accepted	The request is accepted, but it is not immediately acted upon.	
204	No content	There is no content in the body.	

Code	Phrase	Description	
Redirection			
301	Moved permanently The requested URL is no longer used by the server.		
302	Moved temporarily	The requested URL has moved temporarily.	
304	Not modified	The document has not been modified.	
Client Error			
400	Bad request	There is a syntax error in the request.	
401	Unauthorized	The request lacks proper authorization.	
403	Forbidden	Service is denied.	
404	Not found	The document is not found.	
405	Method not allowed	The method is not supported in this URL.	
406	Not acceptable	The format requested is not acceptable.	
	Server Error		
500	Internal server error	There is an error, such as a crash, at the server site.	
501	Not implemented	The action requested cannot be performed.	
503	Service unavailable	The service is temporarily unavailable, but may be requested in the future.	

Figure: Header format
